

Available “In House” Decoration

Doming

Doming is our method of decorating all our golf clubs. Computer generated graphics are printed on to vinyl and then covered with a urethane doming solution. Glossy and pleasantly tactile, doming enhances standard flat surfaces, lending emphasis to your identity in a beautiful way.

Domed decals last longer than standard identity graphics. Years from now, your domed decals will be making the same professional impression it’s making today.

Heat Transfer

Our heat transfer process allows a full colour computer generated logo to be printed onto heat transfer material and pressed onto a variety of our bags and accessories. This process is produced at a lower cost than multi colour screen prints and is perfect for halftones and gradients. A full white underlay must always be present.

Pad Printing

Pad Printing is extremely effective on our headcovers and gloves. A silicone pad is used to transfer the ink onto the product. The pad can hit various levels on a product at one time. Ink colour availability is restricted due to the limited ability to mix inks utilized in this process, and due to the nature of our products, a one colour imprint is all that we offer.
